

# CLEEK

*Agrostis capillaris*

## Browntop bent

Top ranked for use on golf greens - Excellent disease tolerance

- Top performance on greens in STRI (UK) and Scangreen network
- High tolerance to several important diseases
- Winter hardy and good winter colour
- High performance for fairway use too

## Ratings

### Density

### Fineness

### Colour

### Red thread tolerance

### Salt tolerance

## Top performance!

CLEEK is out of European breeding with a wide genetic background offering excellent green performance in Scandinavia and confirms the high level in STRI close mown trials.

## Disease tolerance

One explanation for the top ranking in Scandinavian trials is certainly the good resistance to a range of diseases combined with density and fineness. CLEEK manages to keep a good winter colour and still maintain a good winter hardiness.

## Adapted to greens and fairways

The STRI trials also perhaps very good performance for use on tees/fairways (trials cut 10-15 mm).

## Salt tolerance

CLEEK turned out as one of the better in our salt tolerance trials (coastal areas, irrigation water with salinity...).
